PROFILE

Graduated in AI Development from a higher vocational education programme, with practical experience building Python-based solutions for machine learning, image analysis, web applications and AI-assisted automation during two internships. My previous work in electrical and security systems involved programming and troubleshooting technical systems at customer sites, as well as coordinating installation projects. I am seeking my first role as a junior software developer or AI/ML developer, bringing both development experience and a systematic approach to troubleshooting.

TECHNICAL SKILLS

Core skills: Python, TensorFlow/Keras, scikit-learn, Pandas, NumPy, image classification and model evaluation.

Hands-on experience: SQL/SQLite, Git/GitHub, Flask, Streamlit, PyTorch, Docker, RAG, ChromaDB, web scraping, U-Net, Stable Diffusion and LoRA.

Additional tools: TypeScript, React and Supabase.

INTERNSHIPS IN AI AND SOFTWARE DEVELOPMENT

Internship (LIA) | DeLorean, Stockholm

- Developed a competitor monitoring tool using web scraping and LLM-based analysis. It summarised changes on monitored websites and emailed a recurring report every Friday.
- Built a dashboard allowing users to add or update monitored companies and email recipients without changing the code.
- Developed an accessibility auditing tool in which users entered a URL and selected which checks to run. Combined rule-based WCAG 2.2 checks with RAG-based explanations to help users understand and address accessibility issues.

Internship (LIA) | Nightingale Heart (remote)

- Prepared and quality-checked an open chest X-ray dataset through filtering, class balancing and checks for data leakage. Implemented, trained and evaluated CNN models to distinguish images with and without cardiomegaly.
- Used pretrained segmentation models to identify the heart region and Stable Diffusion inpainting to generate counterfactual X-ray images. Also tested LoRA fine-tuning to adapt generation to medical images.
- Evaluated image quality visually and using cardiothoracic ratio (CTR), structural similarity and a separate classification model. The goal was to preserve anatomy outside the heart region.
- Adjusted training strategies and model settings when results showed artefacts. Planned the work with a fellow student using Kanban and daily check-ins.

EDUCATION AND PROJECTS

Diploma in AI Development (400 YH credits) | Jensen YH, Stockholm · 2024–2026

- Completed coursework in Python (introductory and advanced), databases, web application development, applied AI, data mining, machine learning, deep learning and agile development.
- Represented students on the programme management board, supporting dialogue between students and academic leadership.

Degree thesis | Medical Image Analysis: Opportunities and Limitations of AI

Conducted a literature review of seven peer-reviewed articles from PubMed on AI in cardiac imaging, cancer diagnostics and neurology. Examined CNNs, U-Net, Grad-CAM, generalisability and vulnerability to adversarial attacks, and considered the challenges of clinical adoption. Concluded that AI has potential as clinical decision support, while limited explainability, robustness, data protection and regulatory issues remain obstacles to adoption.

Course project | Skin Lesion Image Classification

Built an image classifier using EfficientNetB0, transfer learning and fine-tuning on a dataset of skin lesion images. Prepared the data, trained and evaluated the model using classification metrics, and used Grad-CAM to visualise image regions influencing its predictions. The project and results are available on GitHub via my portfolio.

PREVIOUS WORK EXPERIENCE

Security Systems Technician | High Security AB · Feb 2020–Jun 2023

- Programmed, configured and troubleshot fire alarms, access control systems and intrusion alarms for commercial and private customers. Identified root causes, applied fixes and verified that systems met requirements.
- Served as a technical resource for the team on programming and complex system configuration. Worked in security-sensitive environments requiring accuracy and discretion.
- Led projects involving four to five technicians, coordinating schedules, task allocation, on-site work and customer follow-up.

Electrician | TT Eltjänst · Aug 2017–Jan 2020

- Installed, maintained and troubleshot electrical systems in accordance with safety regulations. Diagnosed faults systematically and verified installations before handover.

CERTIFICATION AND ADDITIONAL TRAINING

Certified Pega System Architect | Academic Work / Brights · 2023–2024

Completed training on the Pega platform, focusing on application logic, workflows and process automation. Earned the Certified Pega System Architect certification.

PORTFOLIO AND ADDITIONAL INFORMATION
